Scheduling Project

Start Assignment

- Due Tuesday by 11:59pm
- Points 50
- Submitting a file upload
- File Types c
- Available until Sep 30 at 11:59pm

This programming assignment will have you convert a simple python based scheduling program to the C language. The assignment is designed to clear out the C programming cobwebs and confirm that you have a working C programming environment for this course.

Your task is simple. **You must convert scheduler.py used in this week's questions (https://github.com/remzi-arpacidusseau/ostep-homework/tree/master/cpu-sched)** into scheduler.c. Your C version must implement all of the features and mirror the U/I of the python version exactly.

You might want to look at the simplied example of the lottery scheduler that the author gives. You can find **lottery.py at your book authors github site. (https://github.com/remzi-arpacidusseau/ostep-homework/blob/master/cpu-sched-lottery/lottery.py)** This is a simple python implementation of the lottery scheduler that is discussed in Chapter 9 of your book. You can see the **C version of this code, lottery.c, provided at the author's code site. (https://github.com/remzi-arpacidusseau/ostep-code/tree/master/cpu-sched-lottery)** It is not a complete conversion, but the code might help you get started.

Submit a well documented and properly executing scheduler.c. AI will be used to evaluate your documentation efforts and your scheduler will be tested based on the output matching the python programs output.

Do not overthink the argument processing. Your code does not have to process two options on the same switch. For example, -c instructs the scheduler to process the compute flag and -h shows the user help. While both of these are required, -ch would be considered an error.
